Tricky challenge -

Whitney measures the length of two toys.

She says,

Do you agree with Whitney?
Explain your answer.

Whitney is wrong.
Both toys are 4
units long, but the
rubber and the
cubes are different
lengths so the toys
are not the same
length.

English

Practise saying the letter sounds using the PowerPoint presentation provided.

Use the new PhonicsPlay website for today's activity.

Challenge -

I would like you to work with a grown-up to research these three words -

Herbivore – animals who only eat plants.

Carnivore - animals who only eat meat.

Omnivore - animals who eat both plants and meat.

I would love to see photos of your mammal posters!

Something to think about...

Most mammals have teeth to chew their food. Some mammals have flat teeth, like horses, but some mammals have teeth that are sharp, like tigers. Some mammals even have a mix!

I wonder why? Can you think of any reasons?

A mammal's teeth type depends on what kind of food it eats.

Herbivores, such as horses, have flat teeth because they only eat plants which take a lot of chewing!

Carnivores, such as tigers, have sharp teeth because they eat meat, so sharp teeth help them to tear the meat easily.

Omnivores, such as humans, have a mix of some flat teeth (like your very back teeth, the molars) and some sharp teeth (your canine teeth). This is because we eat both plants *and* meat, so we need some teeth to help us chew, and some teeth that help us tear up meat.
